

CICS Explorer: What's new, and what's even newer!

Sophie Green **CICS Explorer Software Engineer** IBM UK

6th November 2018

Session GF

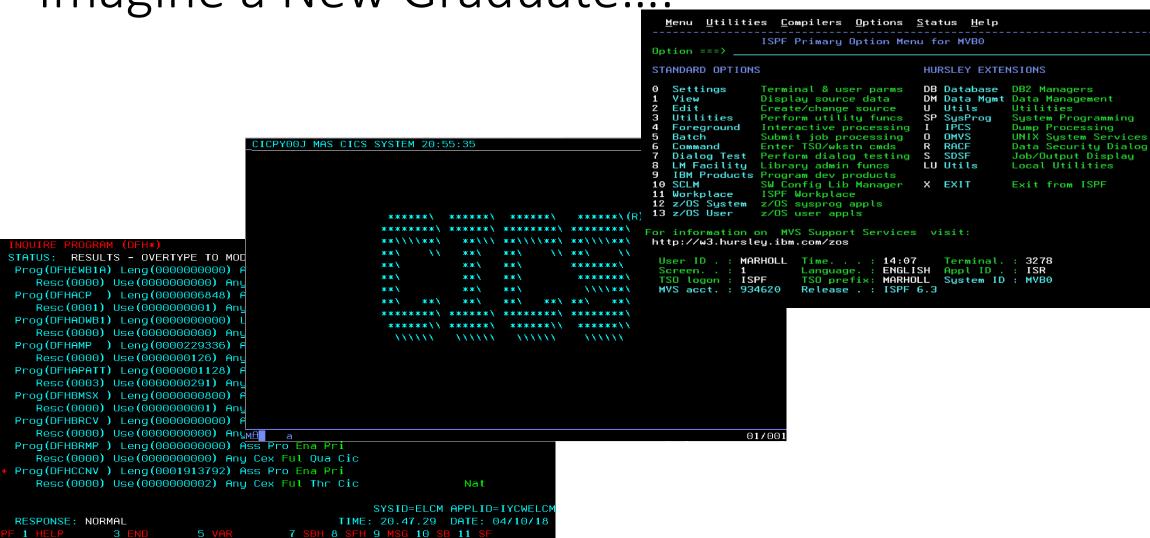

Agenda

- CICS Explorer: What is it?
- What's New in CICS Explorer 5.4 CD
- What's Even Newer: CICS TS 5.5

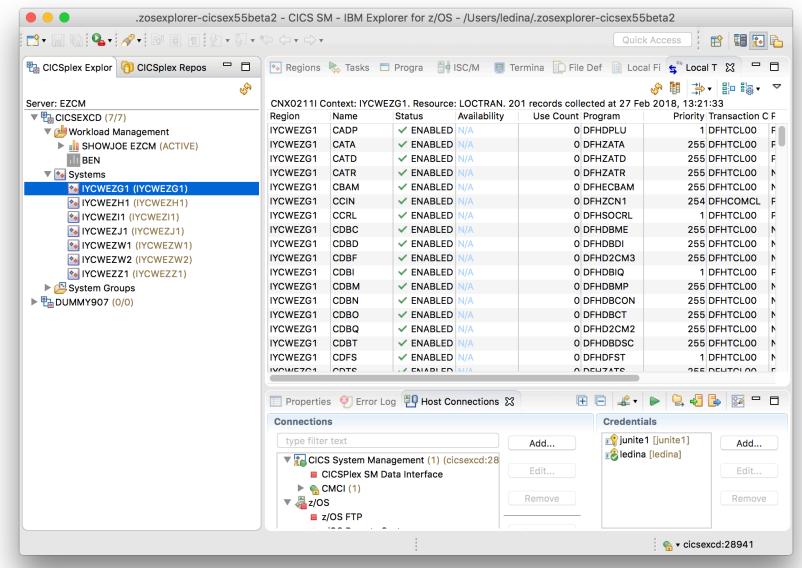

Imagine a New Graduate....

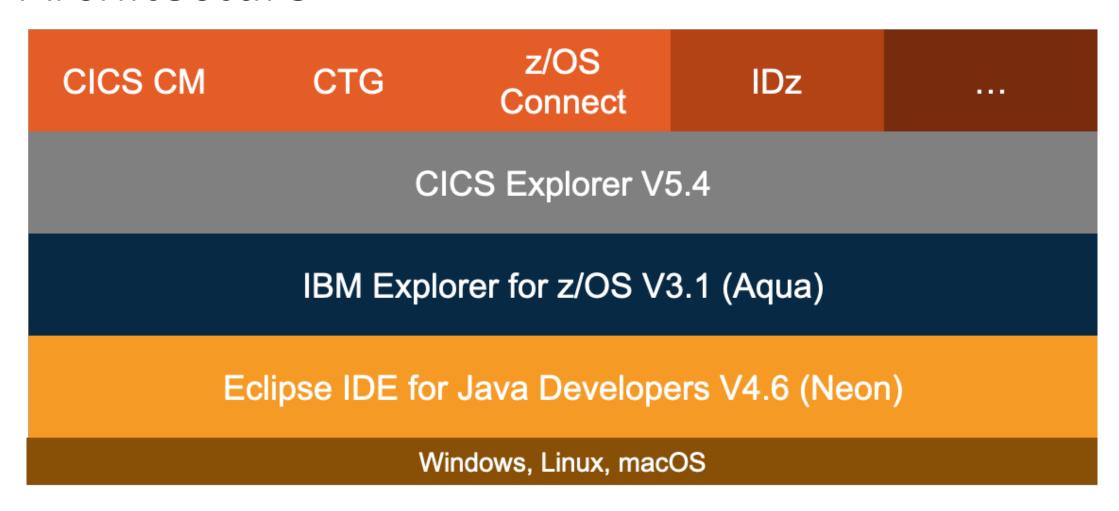

21st Century System Management Tool

Architecture

What Does CICS Explorer do?

- Embeds z/OS Explorer
 - Work with data sets, zFS files and z/OS jobs
- View and manage CICS resources CEMT function
- Create and modify CICS definitions (CEDA function and BAS/WUI function)
- The only guided way to create bundles and Event Processing artifacts
- The best way to write Java programs to run in CICS or Java EE applications for IBM WebSphere Liberty Profile
- Manage CICSPlex SM and view information about your CICS environment
- ... and more!

Get Your Hands Dirty

- CICS Explorer is backwards compatible with older versions of CICS
 - Always use the latest!
- IBM Explorer for z/OS Aqua website https://developer.ibm.com/mainframe/products/downloads/eclipse-tools/
 - Download CICS Explorer stand-alone OR
 - Download a IM for IBM Explorer for z/OS and add CICS Explorer to it
- Open Beta website: https://www.ibm.com/it-infrastructure/z/cics/trials

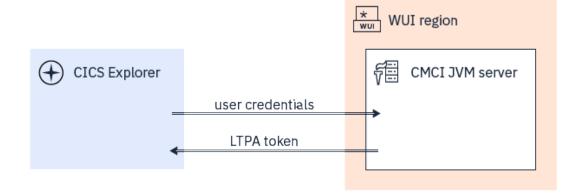

What's New in CICS Explorer 5.4 CD

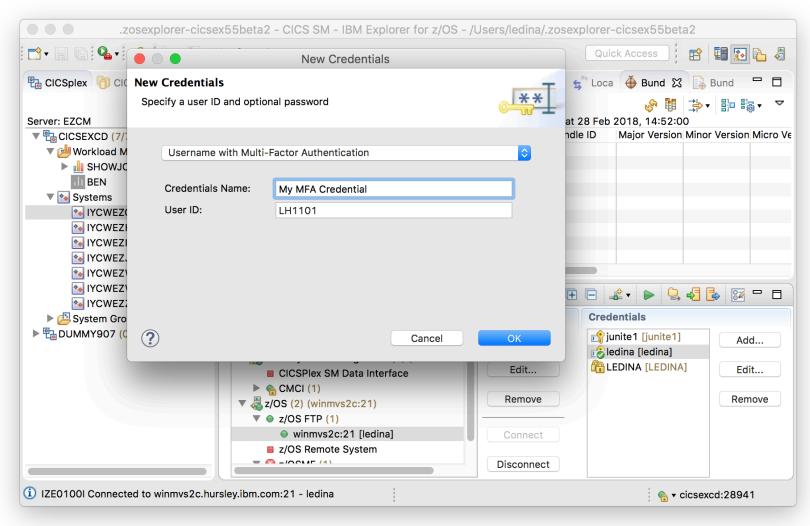

Security: Multi-Factor Authentication Support

- Multi-Factor Authentication for z/OS or equivalent product configured with RACF
- CICS Explorer Version 5.4.0.4 or later
- CICS TS V5.4 with APAR PI87691 or later: WUI region and CMAS at least
- WUI configured to enable the use of CMCI and accept MFA tokens

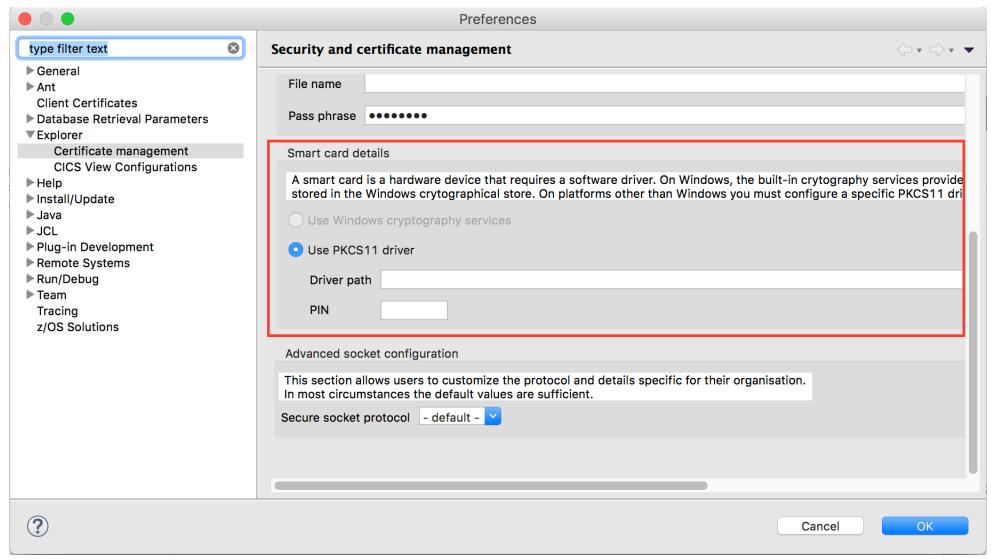

Security: Multi-Factor Authentication Support

- New MFA credential type
- Password not stored
- No automatic reconnect
- CMCI or z/OS Remote
 Systems

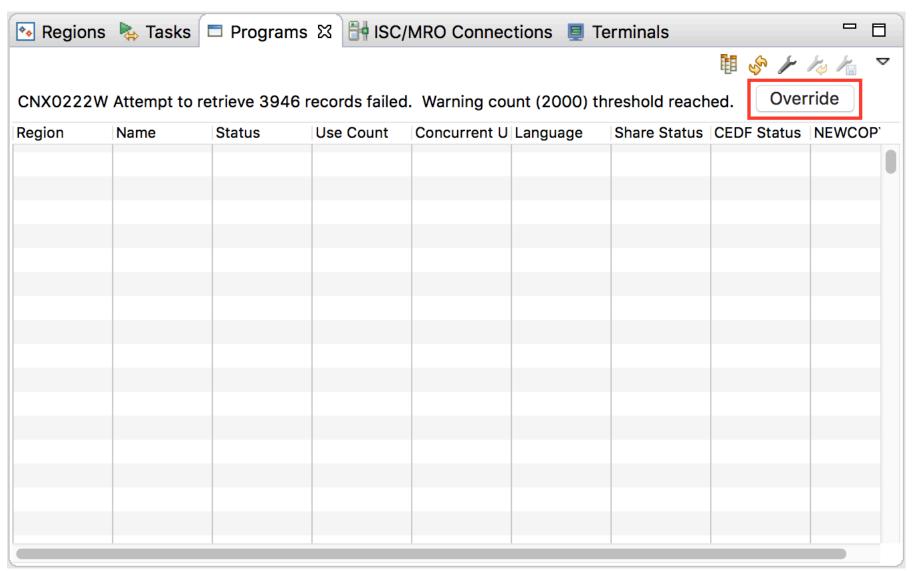

Security: Smart Card Support

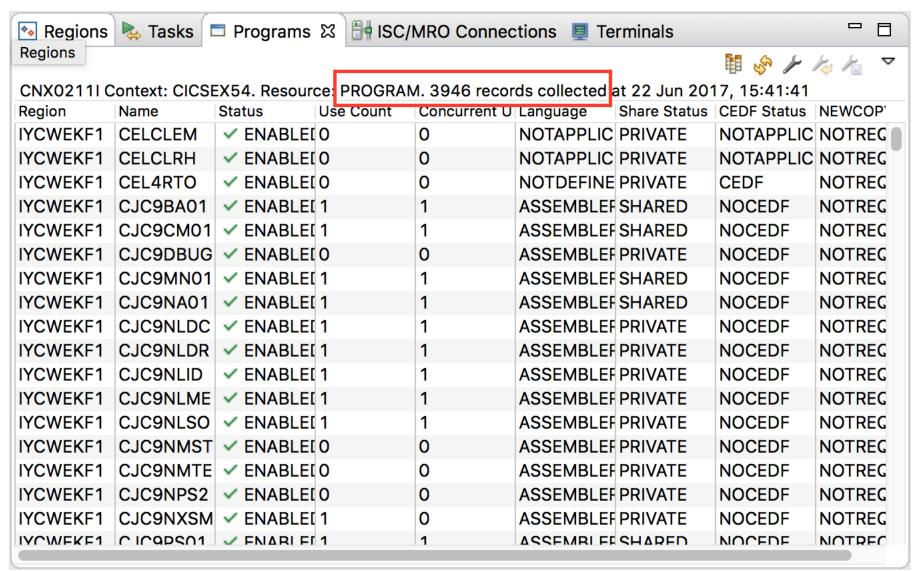

Overriding Warning Count

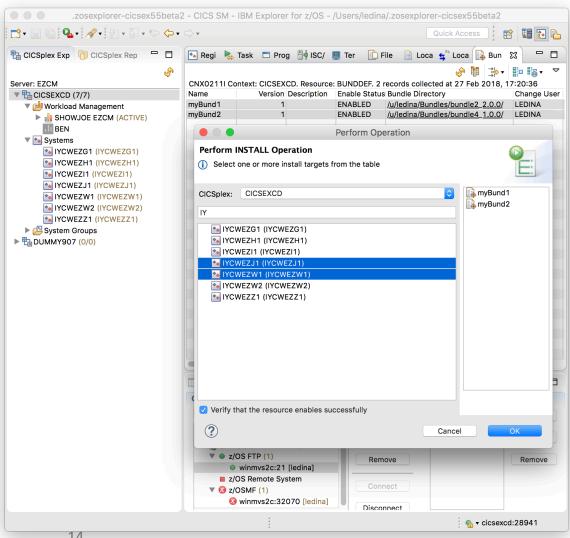

Overriding Warning Count

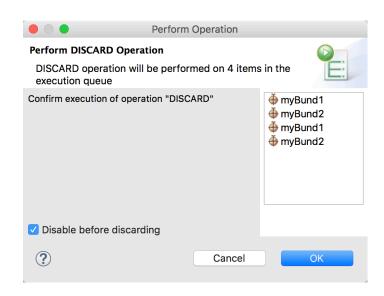

Bundle Life-Cycle Improvements

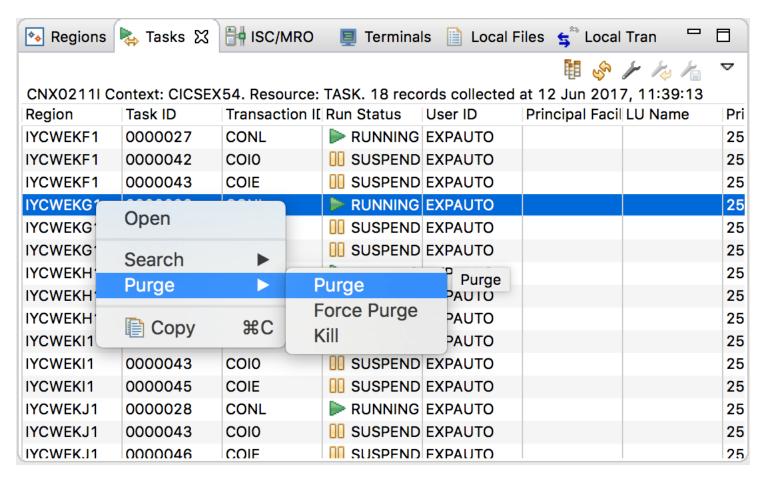

- Install/Enable and Disable/Discard
- Filtering on install
- Multiple selection
- Hyperlinks

JVM Server and Associated CICS Tasks Improvements • Remove dis

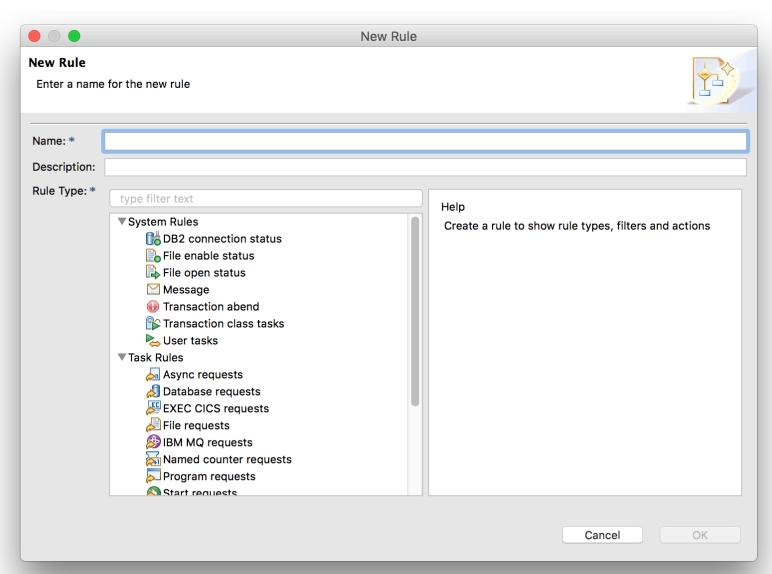

- Remove disruptive tasks from the JVM
- Remove associated threads and tasks in a more orderly sequence when disabling the JVMSERVER.

Policy-Based Management: System Rules

- Automated control over critical system resources
- Same capabilities as system events
- Expanded to support a new set of system-based rules

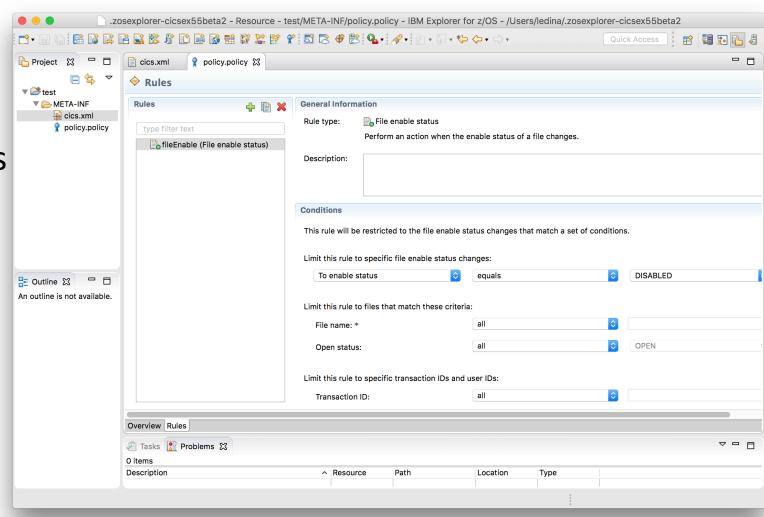

Policy-Based Management: System Rules

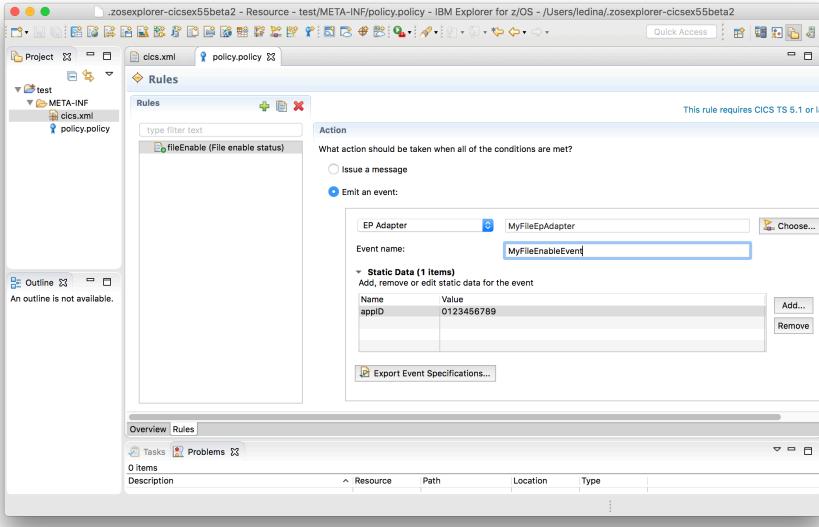

- New Policy Rule Editor
- Multiple rules in a policy
- User-defined abend codes

- Each rule specifies:
 - Condition
 - Action

Policy-Based Management: Static Data

- Action section of a policy
- A way of passing information to the event consumer

Demo

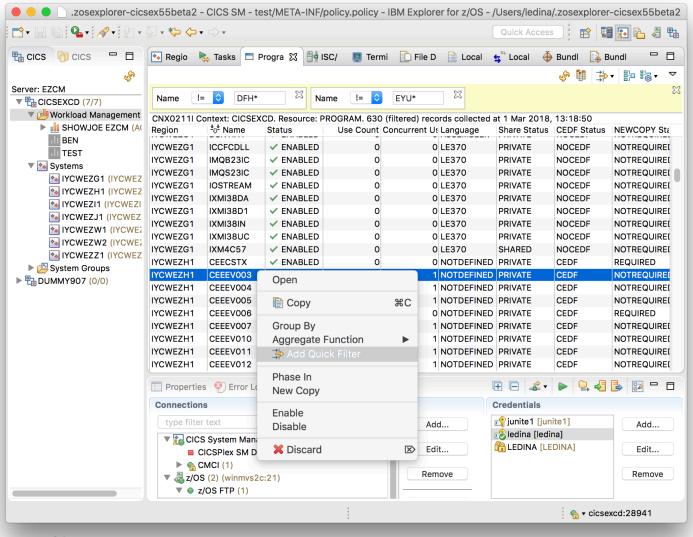

Scenario 1: File Enable Policy

 Stan, the system programer, has identified certain files that are critical to their system.

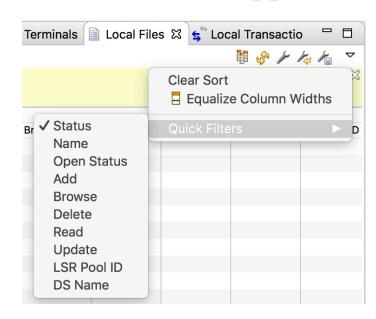

• He would like to be notified if they ever get DISABLED so he can respond as quickly as possible to fix the issue.

Quick Filters

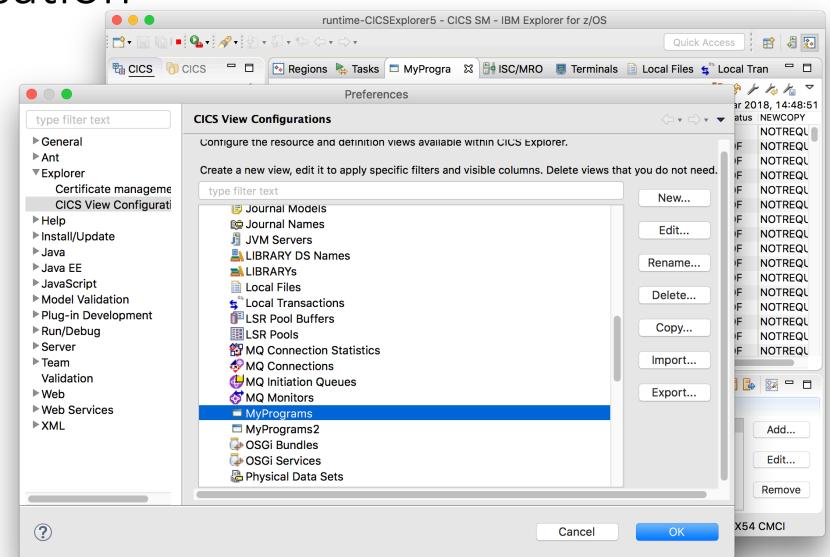

- Drill down to particular data
- Multiple per attribute
- Choice of operators
- Easy to remove

View Customisation

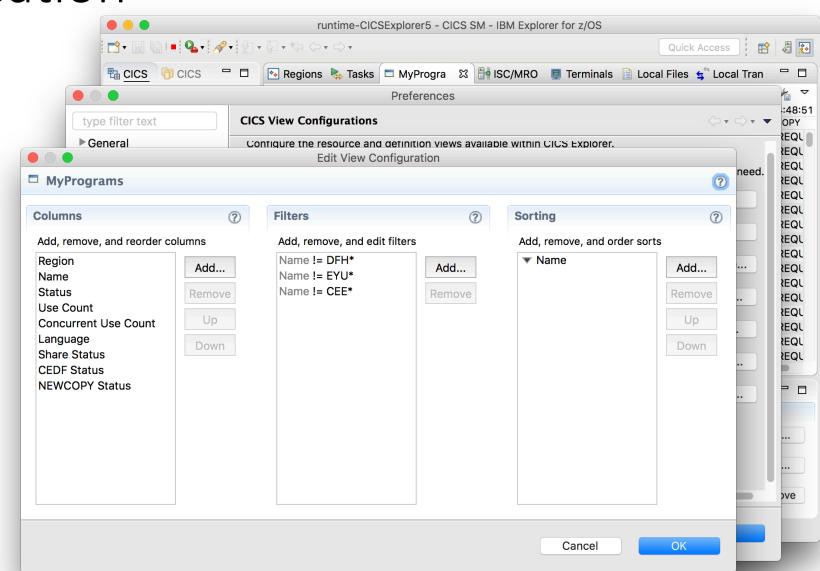

- Create your own
- More than one view per resource type
- Delete views
- Changes applied to menus and quick access also

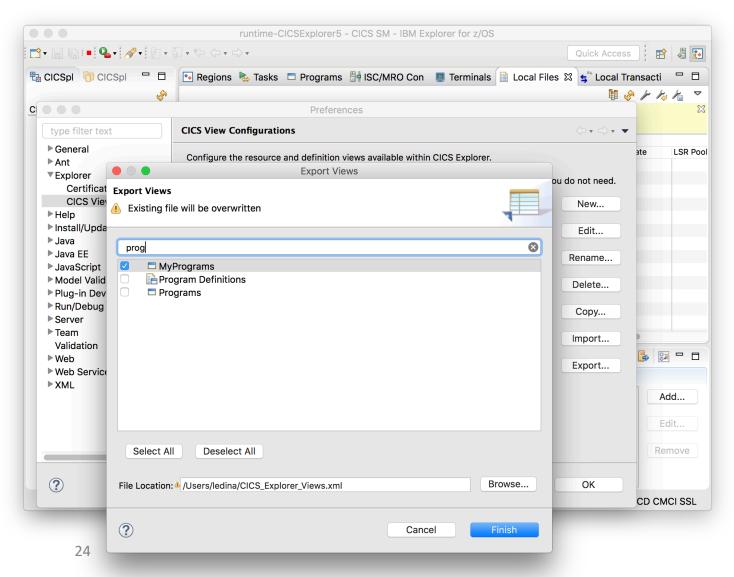

View Customisation

- Customize
 - Columns
 - Filters
 - Sorts
- Choice of operators for filters (not just "equals")
- Sort directions

View Sharing: Export

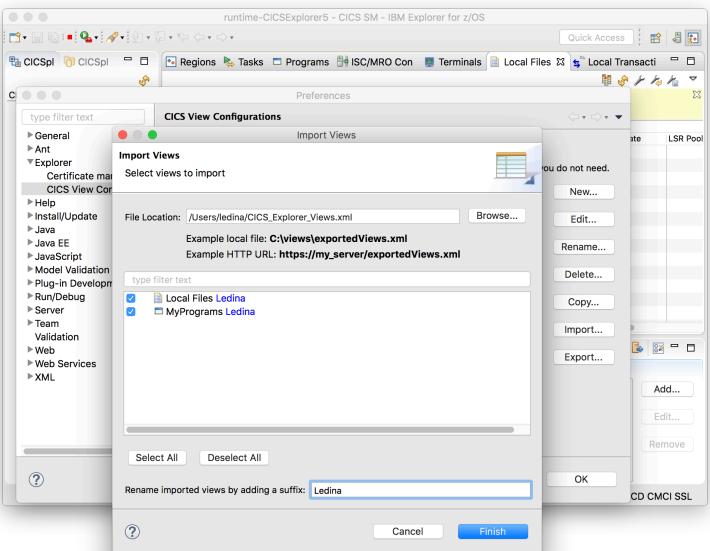

- Enable sharing across teams
- Setting up new starters with views useful for their tasks
- Back-up purposes
- Choose what to export

View Sharing: Import

- Imported into CICS Explorer instances either as:
 - A file OR
 - From a central Web server
- Customise name on import
 - Avoids clashes

Demo

Scenario 1: Customising and Sharing Views

 Stan, the senior system programmer, has noticed there are certain operations on some views he performs over and over again. He wants to save them so he doesn't have to manually do them each time.

Julian, joined the team as a junior system programmer. Stan shares
his customised views with Julian, so Julian has all he needs to perform
his everyday tasks.

What's Even Newer: CICS TS 5.5

 We want CICS Explorer 5.5 to be your go-to interface for CICS system management instead of the Web UI

 Find the bits that are missing, and bring them to Explorer in a way that's natural for a rich desktop product

Our Goal

"A system programmer no longer needs to configure and deploy the WUI, because the capabilities he needs are <u>better</u> in CICS Explorer"

Aggregation

 Take a set of data and perform some analysis on it to make it easier to spot discrepancies

• Divide records into groups where the values of certain attributes match

• Within a group, perform analysis on the values of attributes that don't match

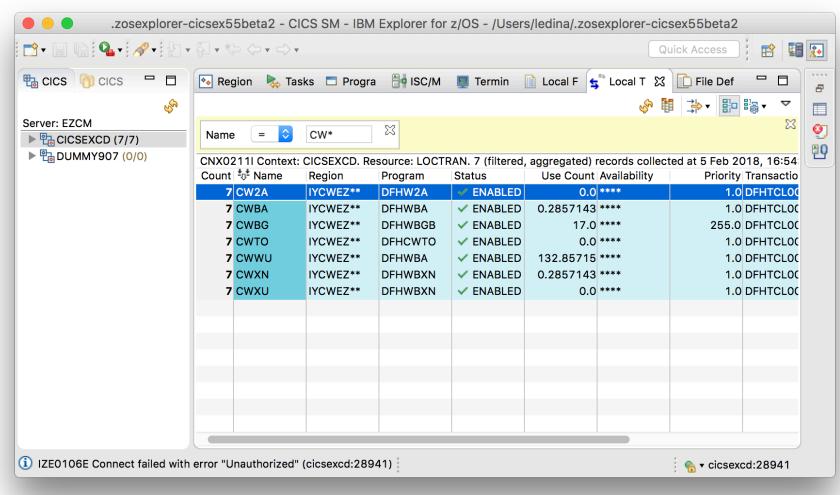

Grouping

- Similar to summarise in WUI
- More powerful

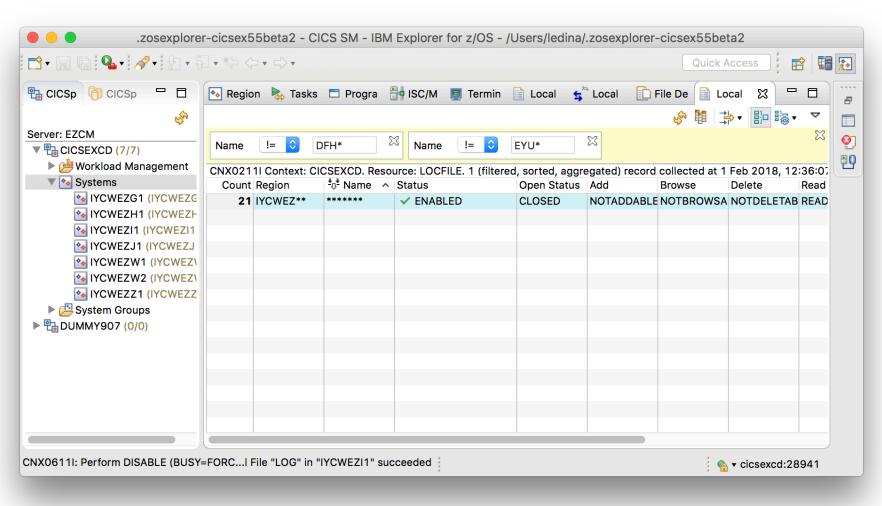

Grouping

- Grouped columns in darker shade
- Other columns aggregated
- Stars (*) show differences
- Count column shows number of resources aggregated in each row

Aggregation

- No group
- All fields are aggregated
- Good for spotting anomalies

DEMO

Scenario 2: Something Wrong With a Transaction

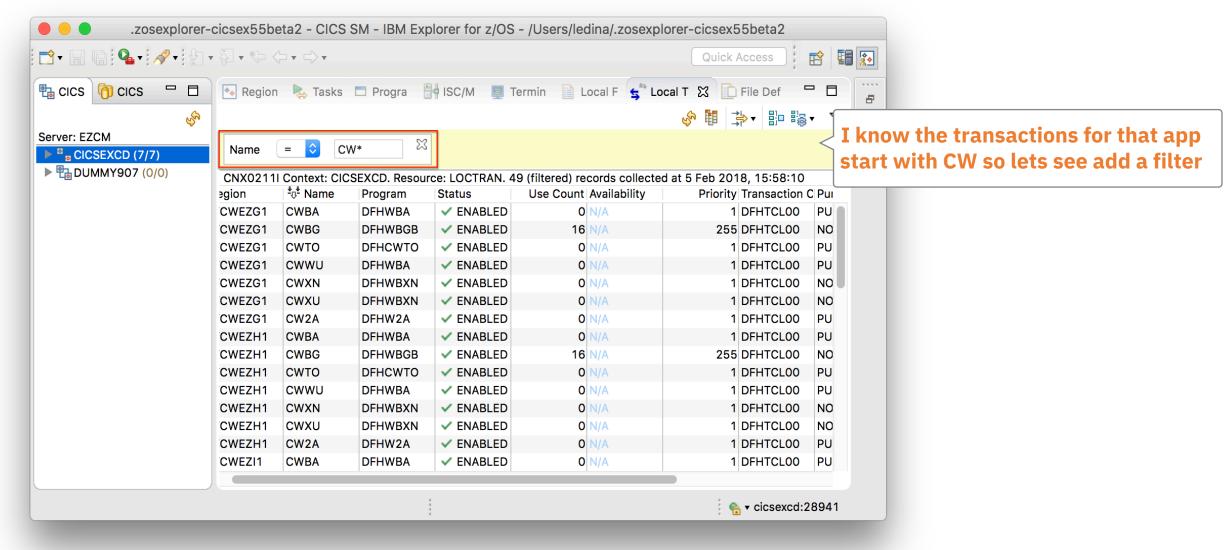

• Annette, the operations analyst, has seen some anomalies and performance issues with an application running in the system.

• The error message suggests there is an issue with a transaction.

 Annette contacts Stan, the system programmer, and informs him of the problem

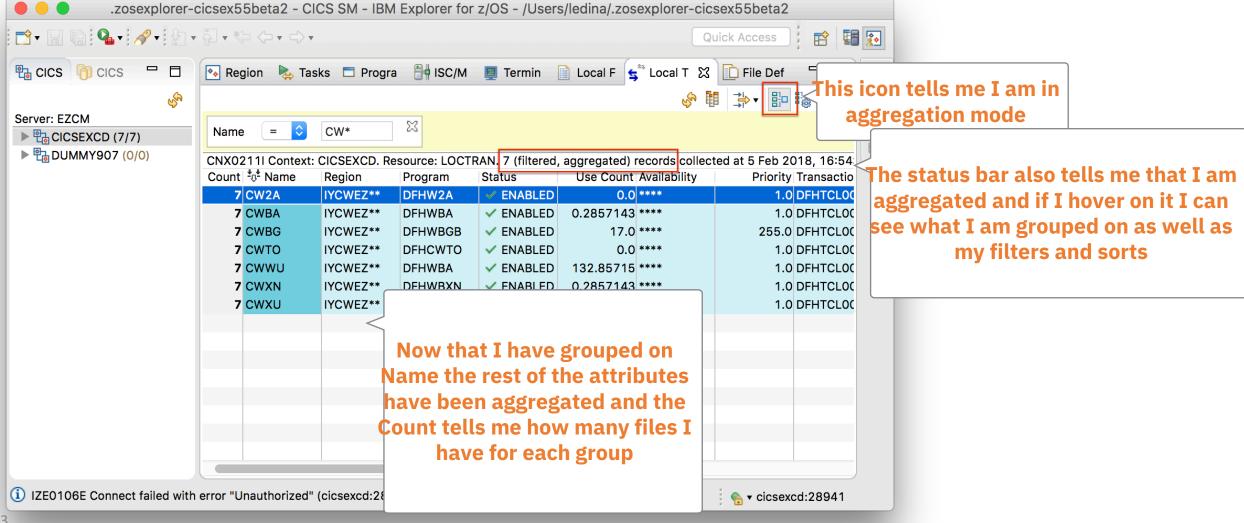

Scenario 3: Something Wrong With a Transaction

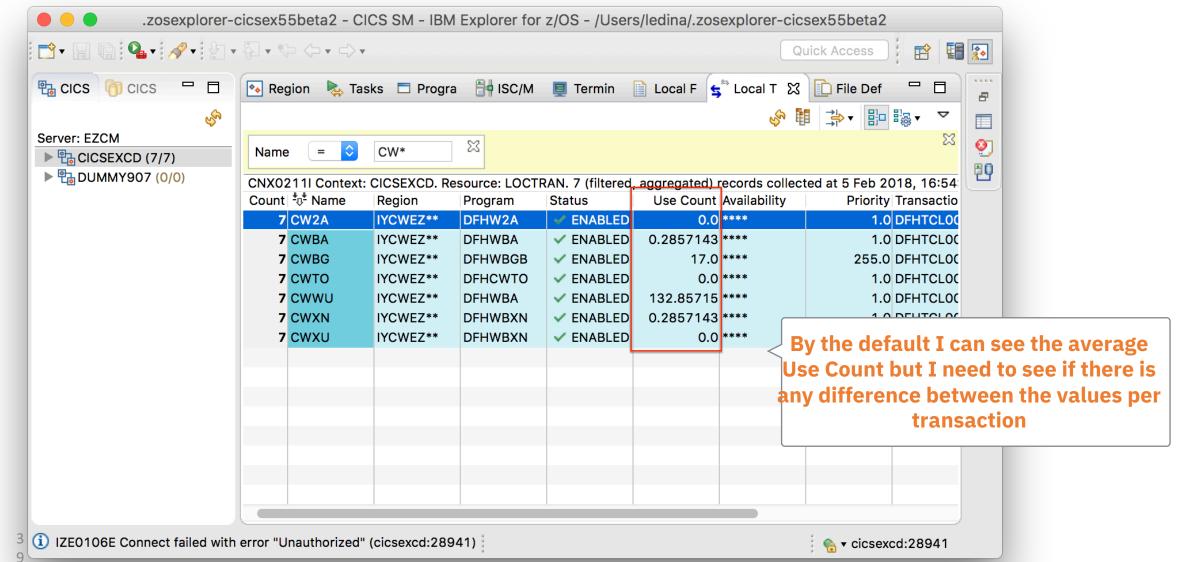

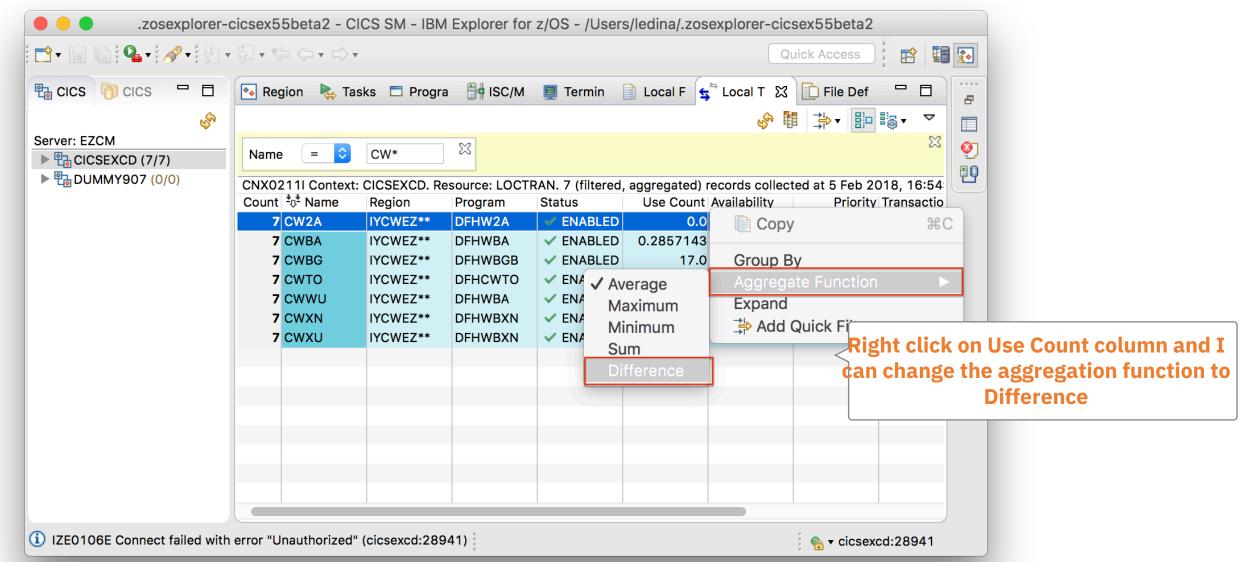

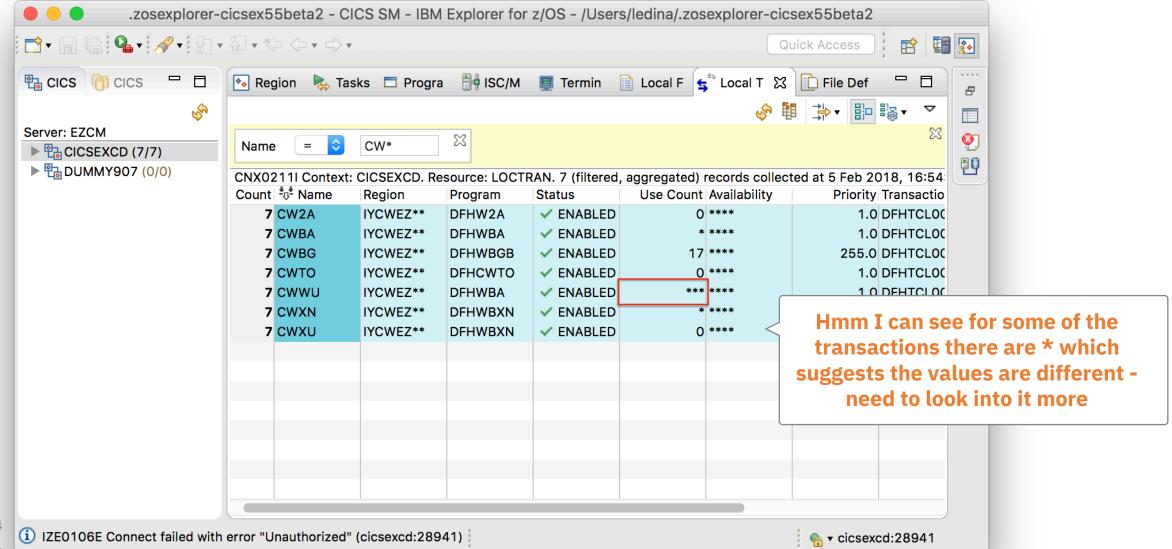

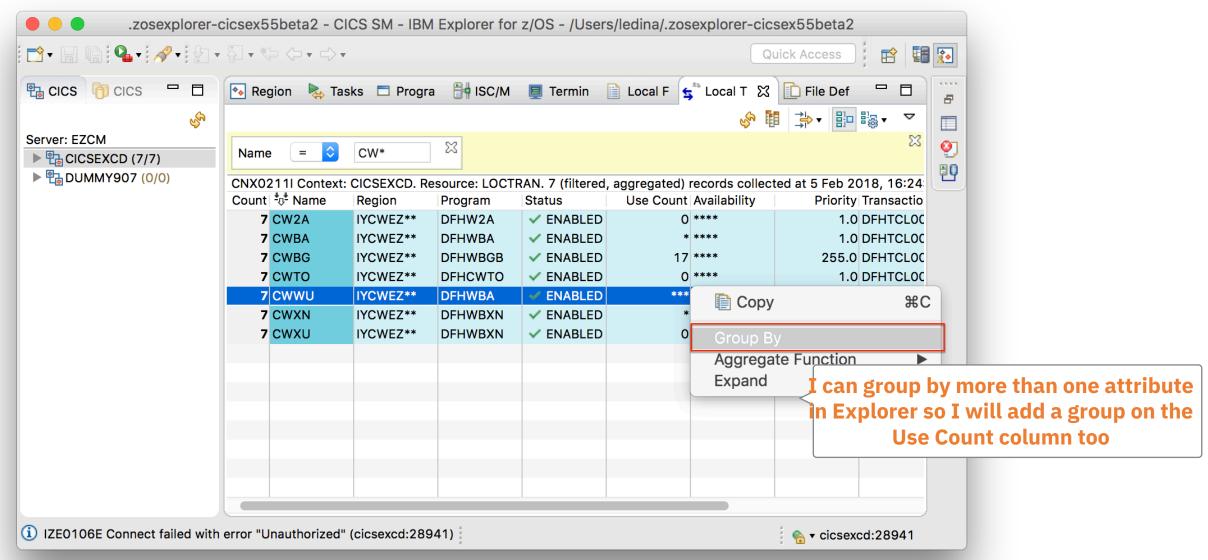

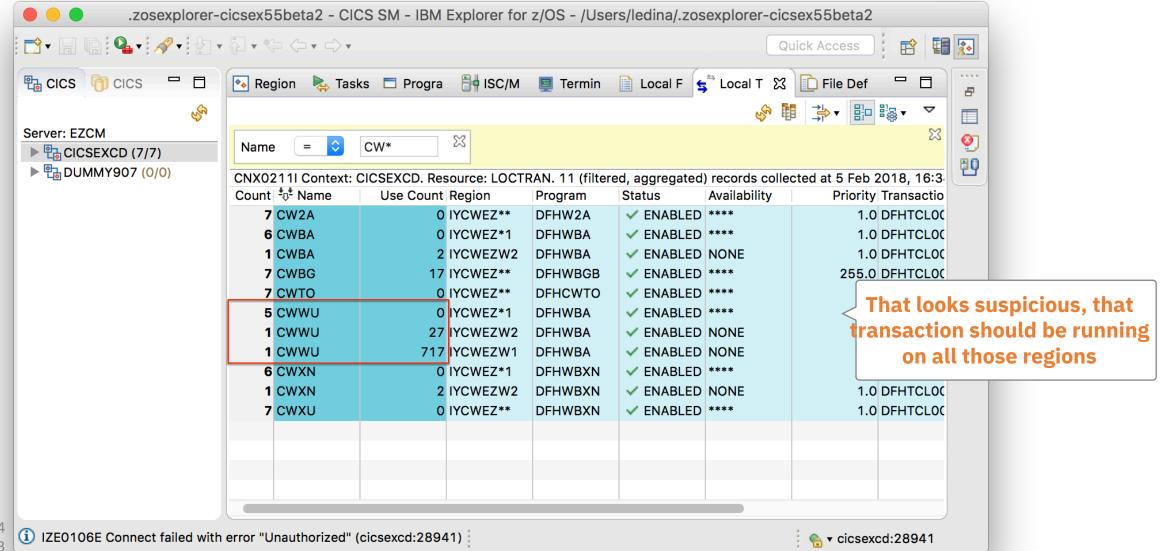

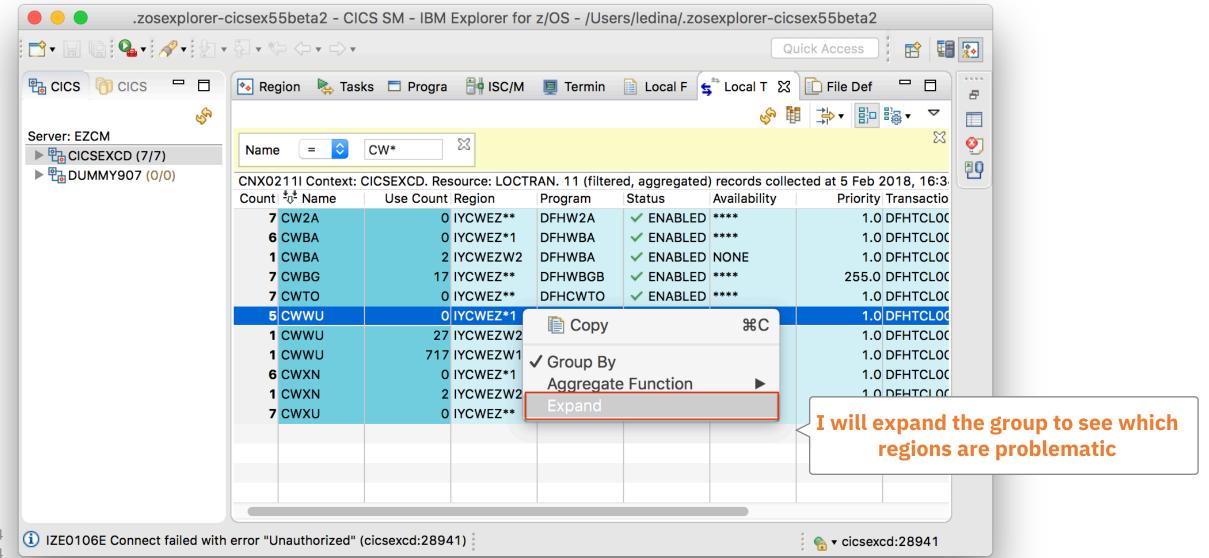

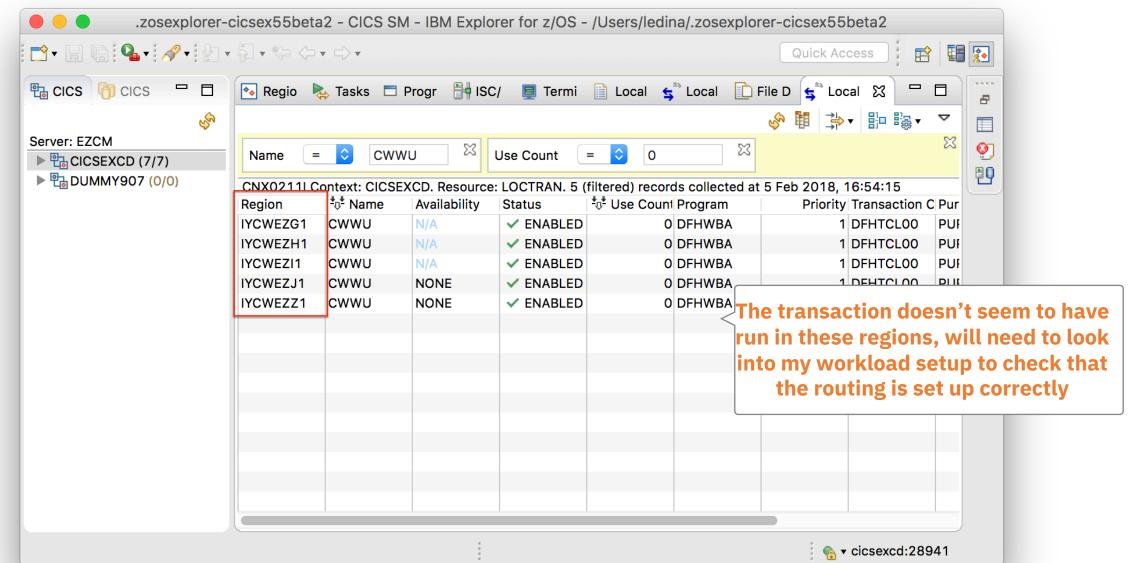

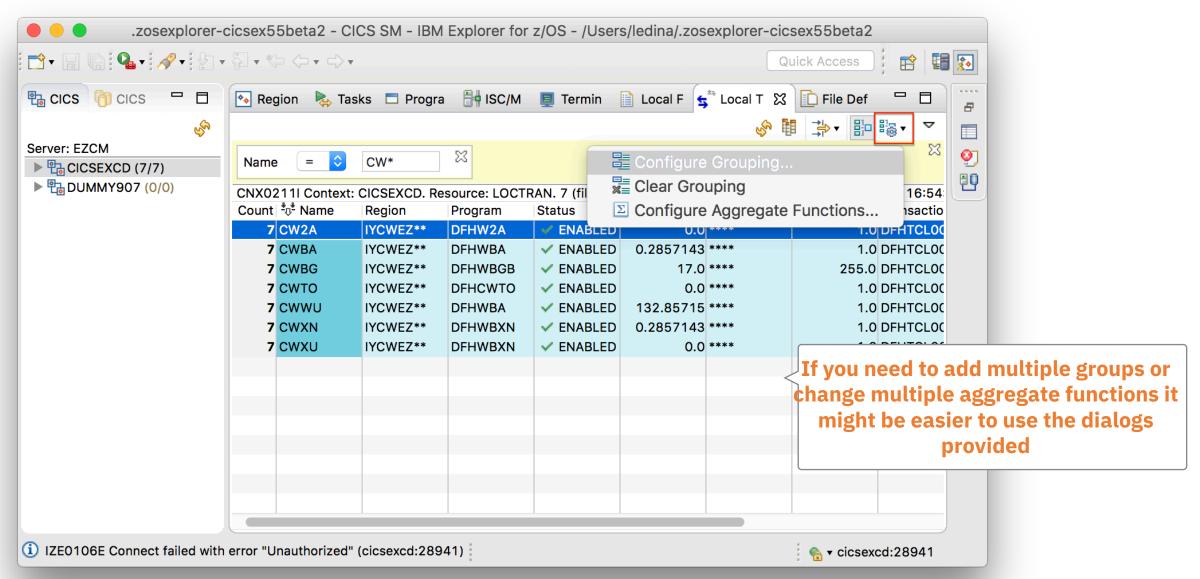

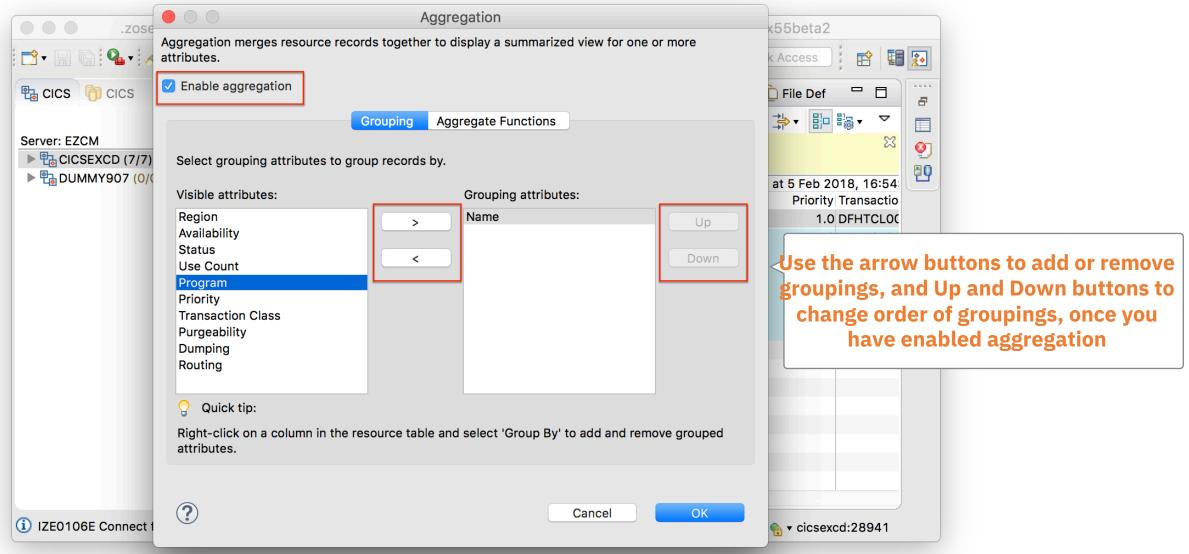

Making Multiple Changes

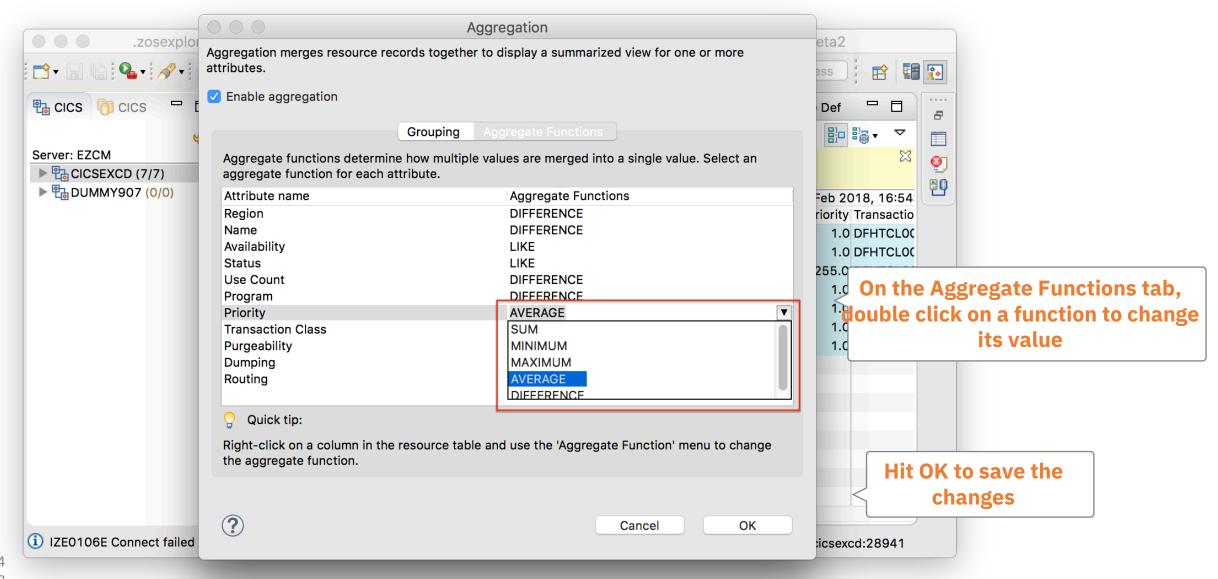

Making Multiple Changes

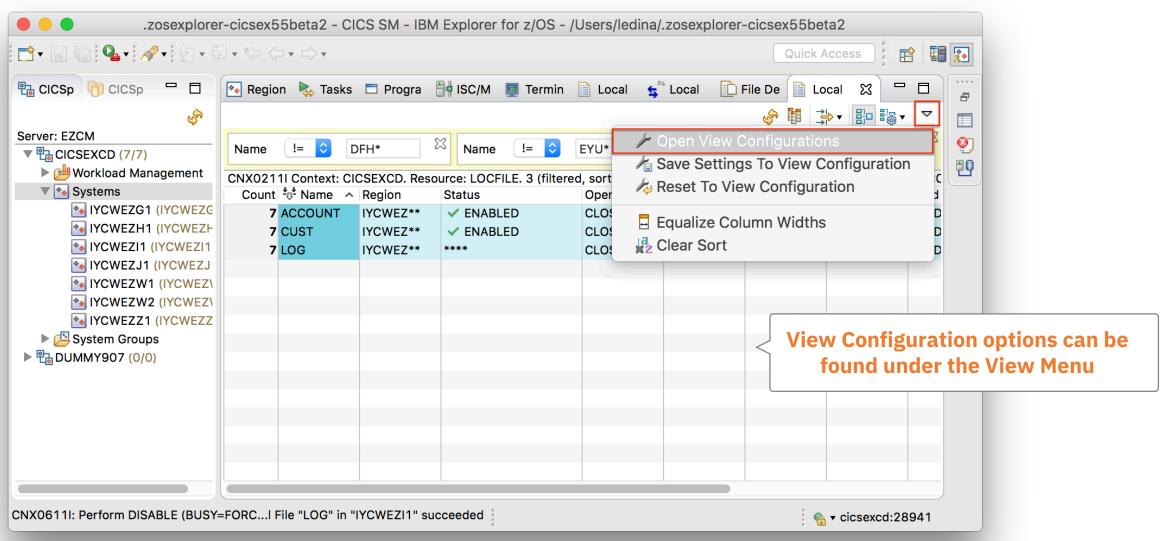

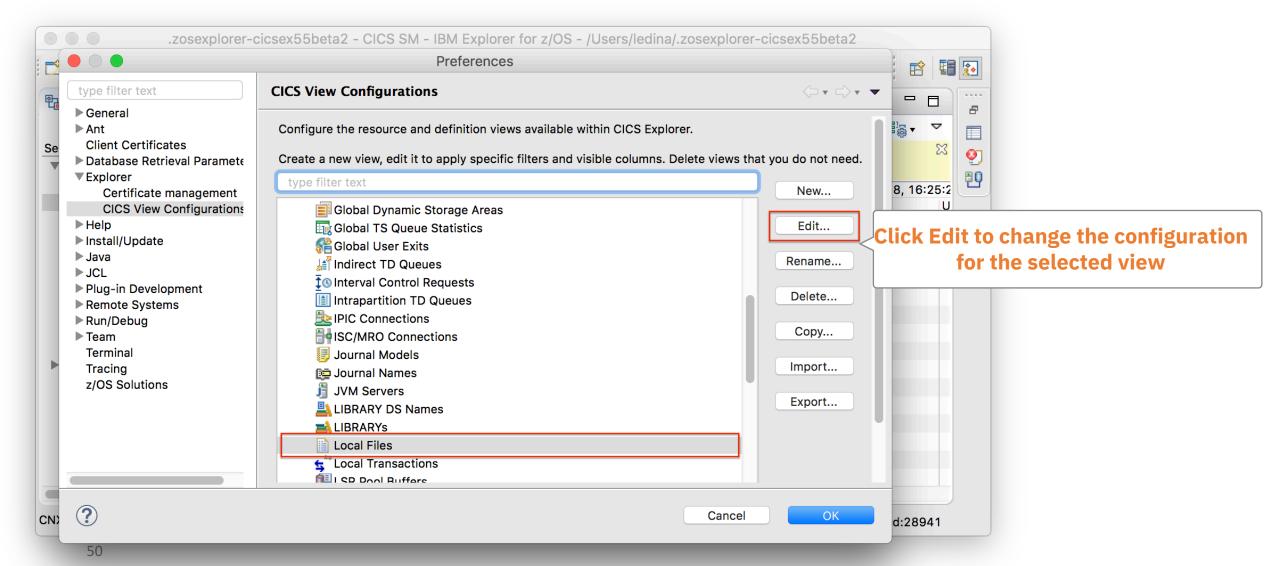

Making Multiple Changes

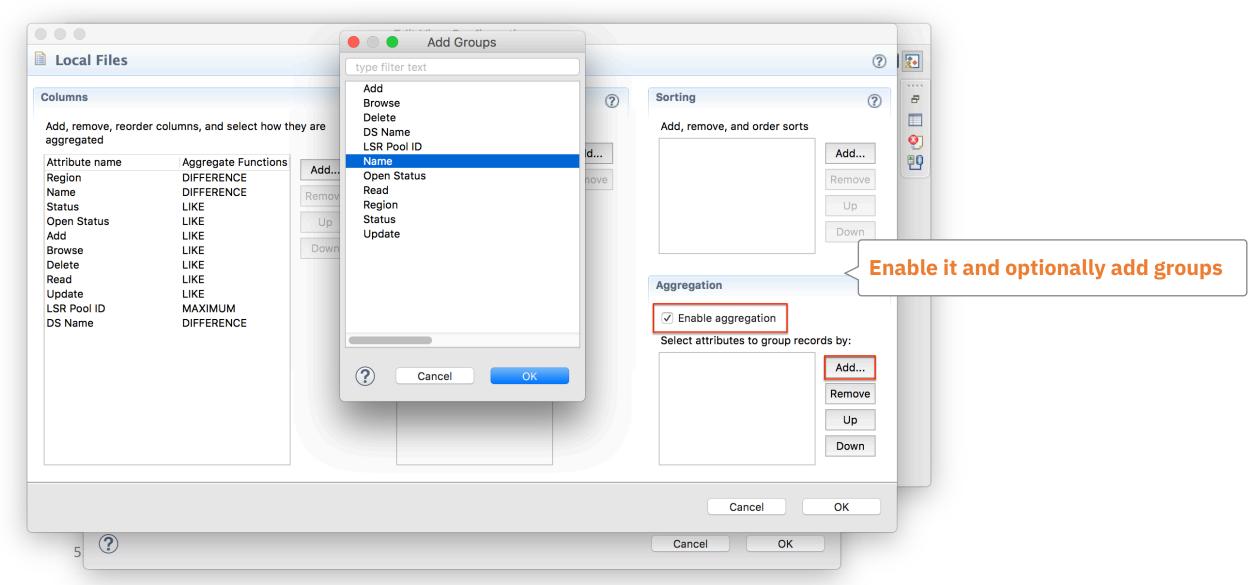

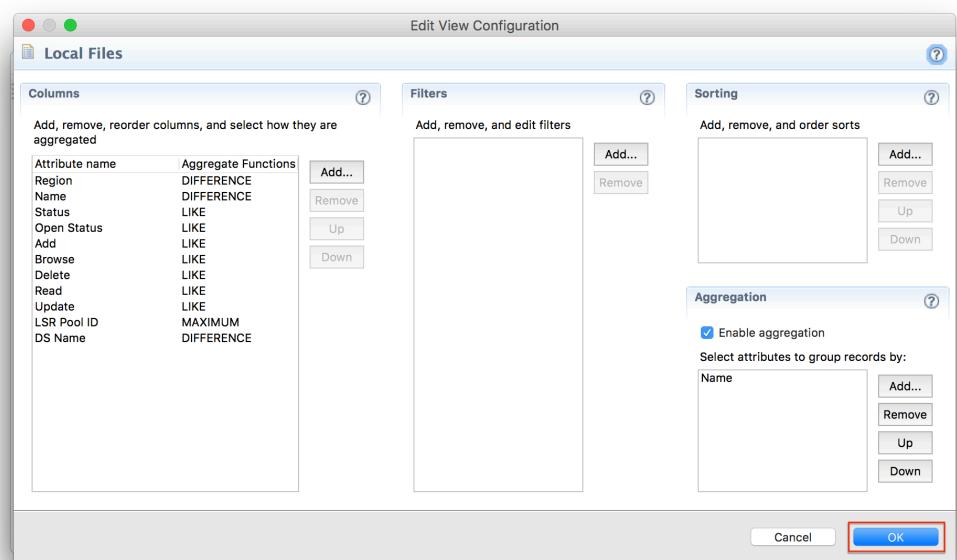

Hit OK to save the changes

Aggregate Functions

- Strings
 - DIFFERENCE: Show analysis of common characters
- Enumerations (CVDA / EYUDA values)
 - LIKE: Show whether all of the enumeration values match
- Numbers
 - MINIMUM: Show the minimum value
 - MAXIMUM: Show the maximum value
 - AVERAGE: Show the mean average
 - SUM: Show the total of all values
 - DIFFERENCE

Aggregation vs WUI

More flexibility around configuring

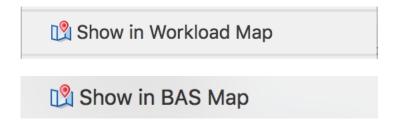

Saveable as part of view configuration

Group by multiple columns

Map

- Show the relationship between resources
- Eligible resources get an extra right click menu option

 Open beta has support for Map operations on workload management 'definition' resources, and BAS resources

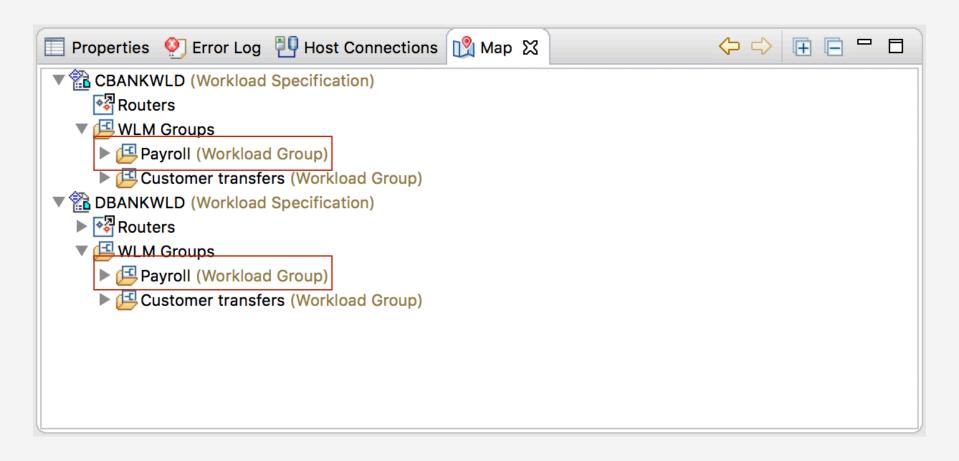

Scenario 3: Something wrong with a specification

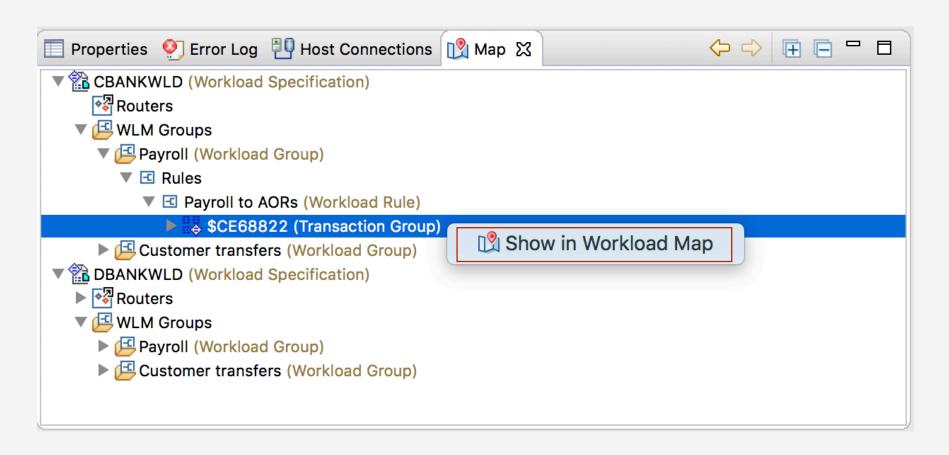

- Annette, the operations analyst, has identified performance issues with the payroll application running in the system.
- She contacts Stan, the system programmer, and informs him of the problem.
- Stan knows the WLM specification associated with that application so decides to take a look.

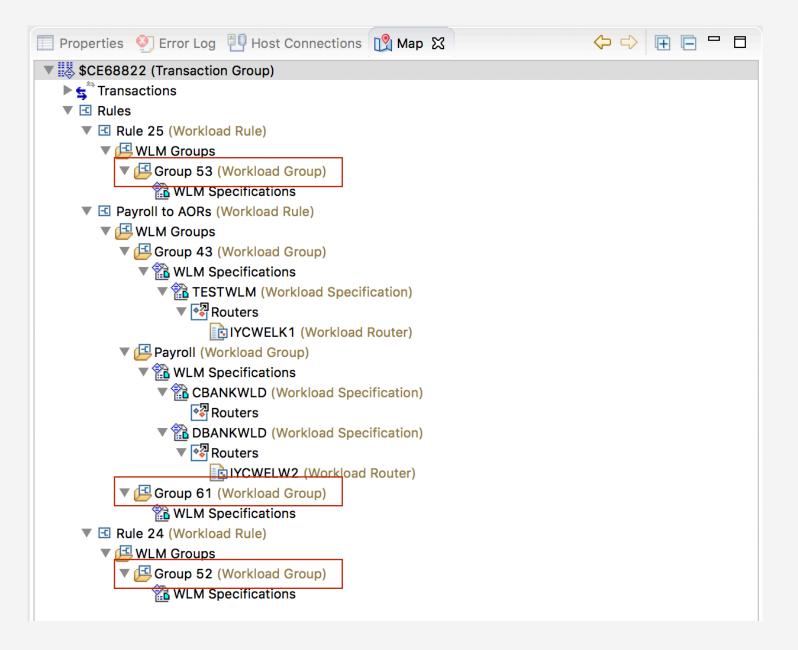

Map on 2 Workload Specifications

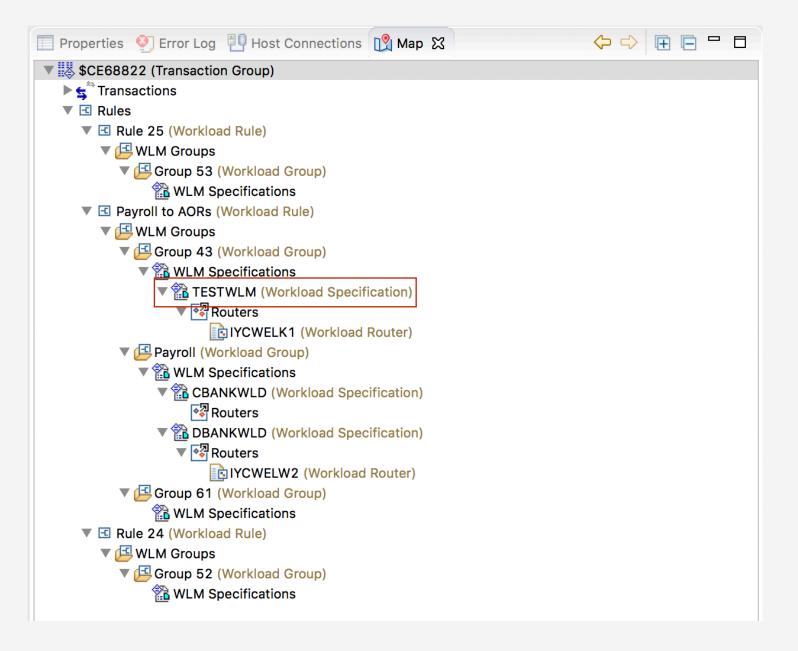

The new Map view has opened with our 2 Workload Specifications as the root. Expanding WLM Groups shows the groups in each spec, and both contain the Payroll group.

Expanding the Map to show further relationships shows the Transaction Group associated with this Workload Group. Remapping on the Transaction Group \$CE68822 can show where else it is used.

Expanding the map shows all Specifications that this Transaction Group is used in. We can identify Workload Groups that are orphaned, and should be cleaned up as they aren't used in any Specifications.

We can also see from the map that the Transaction Group is being used in another Workload Specification (TESTWLM) that isn't our intended CBANKWLD and DBANKWLD. This is likely the cause of our performance issues.

The GraphQL API server

 Aggregation in CICS Explorer relies on the new GraphQL API for CICS system management

- Query many types of CICS resources across CICSplexes in a single request.
- Can specify exactly what data it needs
- Explicitly expressed inherent relationships between CICS resources

Must use CMCI JVM server

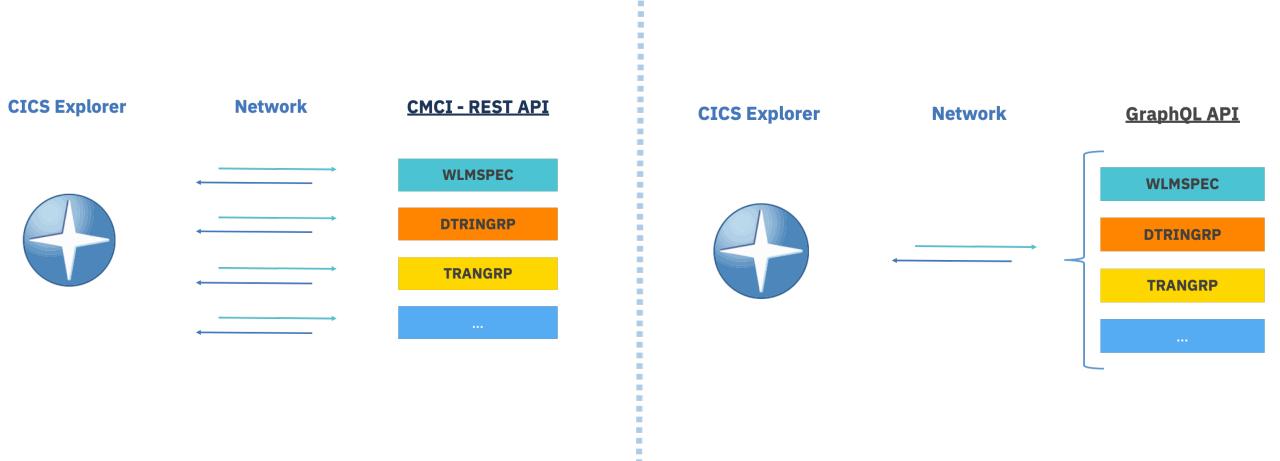

REST vs GraphQL: WLM Editor

REST vs GraphQL: WLM Editor

The GraphQL API server

- This API is served by a component that is (currently) a separate install
- You can try this API out for yourself from the Open Beta site!
- Incorporate into your automation

```
History
    # Welcome to GraphiQL
    # GraphiQL is an in-browser tool for writing, validating, and
    # testing GraphQL queries.
    # Type queries into this side of the screen, and you will see intelligent
    # typeaheads aware of the current GraphQL type schema and live syntax and
    # validation errors highlighted within the text.
 9
    # GraphQL queries typically start with a "{" character. Lines that starts
    # with a # are ignored.
12
    # An example GraphQL query might look like:
14
15
            field(arg: "value") {
16
              subField
19
     Keyboard shortcuts:
22
            Run Query: Ctrl-Enter (or press the play button above)
24
25
        Auto Complete: Ctrl-Space (or just start typing)
26
27
28
```

GraphiQL

A GraphQL API call editor

You can use it too! Easiest way is via the GraphiQL API Explorer:

https://host:port/graphiql

cicsplex
cicsplexes
__schema
__type
CICSplexType Query an individual CICSplex in this environment
